

SPEC CPU2006 SPECfp_rate performance on Dell, HP, and IBM servers

Executive summary

Dell Inc. (Dell) commissioned Principled Technologies (PT) to measure the SPEC CPU2006 SPECfp_rate2006 performance of the following three servers:

- Dell PowerEdge 2970 with two Dual-Core AMD Opteron 2222 SE processors
- HP ProLiant DL380 G5 with two Dual-Core Intel Xeon 5160 processors
- IBM System x3650 with two Dual-Core Intel Xeon 5160 processors

SPEC CPU2006 is an industry-standard benchmark created by the Standard Performance Evaluation Corp. (SPEC) to measure a server's compute-intensive performance. The benchmark consequently stresses the CPU and memory subsystems of the system under test. (For more information on SPEC CPU2006 and other SPEC benchmarks, see www.spec.org.)

The SPEC CPU2006 benchmark consists of two benchmark suites, each of which focuses on a different aspect of compute-intensive performance. CINT2006 measures and compares compute-intensive integer performance, while CFP2006 measures and compares compute-intensive floating-point performance. A "rate" version of each, which runs multiple instances of the benchmark to assess server throughput, is also available. We ran only the CFP2006 SPECfp_rate benchmark.

Figure 1 shows the relative SPECfp_rate2006 performance of each server normalized to that of the poorest-performing server. The Dell PowerEdge 2970 achieved a score of 51.6, a 21.1 percent performance increase over the HP ProLiant DL380 G5, which achieved a score of 42.6, and a 25.2 percent performance increase over the IBM System x3650, which achieved a score of 41.2 (see Figure 1).

KEY FINDINGS

The Dell PowerEdge 2970 achieved a SPECfp_rate2006 score of 51.6, a 21.1 percent performance increase over the HP ProLiant DL380 G5, which achieved a score of 42.6, and a 25.2 percent performance increase over the IBM System x3650, which achieved a score of 41.2 (see Figure 1).

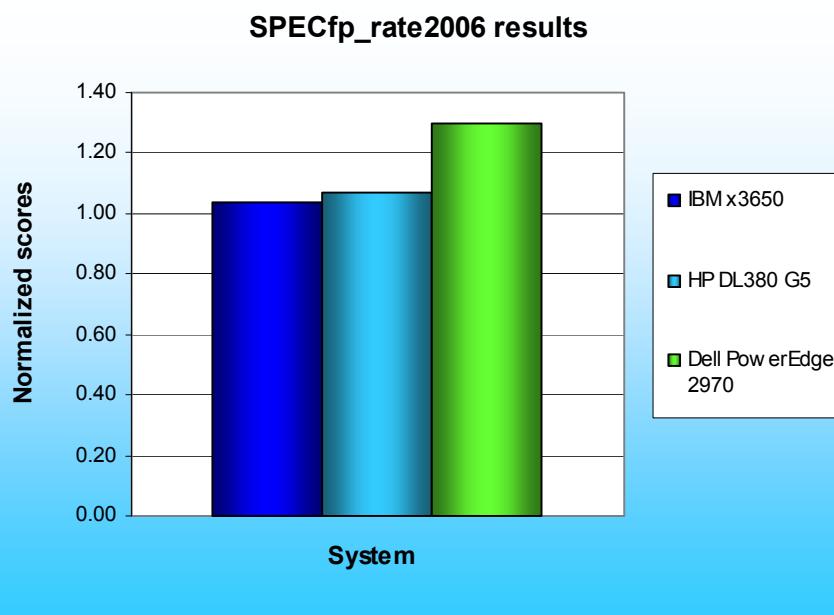

Figure 1: Normalized performance results of the test servers. Higher numbers are better.

Workload

The SPEC CPU2006 workload includes two benchmark suites: CINT2006 and CFP2006. We ran only the CFP2006 benchmark, which focuses on measuring and comparing compute-intensive floating-point performance. Specifically, we measured the SPECfp_rate2006 results for the test servers with four users.

Figure 2 lists the 17 applications that compose the CFP2006 benchmark. SPEC wrote six of the applications using Fortran, three using C, four using both Fortran and C++, and four using C++.

Name	Application area
410.bwaves	Fluid dynamics
416.gamess	Quantum chemistry
433.mic	Physics/Quantum chromodynamics
434.zeusmp	Physics/CFD
435.gromacs	Biochemistry/Molecular dynamics
436.cactusADM	Physics/General relativity
437.leslie3d	Fluid Dynamics
444.namd	Biology/Molecular dynamics
447.dealII	Finite element analysis
450.soplex	Linear programming, Optimization
453.povray	Image ray-tracing
454.calculix	Structural mechanics
459.GemsFDTD	Computational electromagnetics
465.tonto	Quantum chemistry
470.IBM	Fluid dynamics
481.wrf	Weather
482.sphinx3	Speech recognition

Figure 2: The applications that make up the CFP2006 benchmark.

A CFP2006 run performs each of the 17 application (tasks) three times and reports the median for each. It also calculates the geometric mean of those 17 results to produce an overall score.

Test results

Figure 3 details the results of our tests with four users for SPECfp_rate2006. We determined the number of users based on the number of execution units in a given server. We used the same number of SPECfp_rate2006 users as processor execution units, so there is a one-to-one ratio.

SPECfp_rate2006 performs three runs of each benchmark in the test suite and records the median, so the final score is a median of three runs. Higher scores are better.

Server	SPECfp_rate2006 results	SPECfp_base_rate2006 results
Dell PowerEdge 2970	51.6	48.7
HP DL380 G5	42.6	41.3
IBM x3650	41.2	39.8

Figure 3: SPECfp_rate2006 results for the three servers.

Test methodology

Figure 4 summarizes some of the key aspects of the configurations of the server systems; Appendix A provides detailed configuration information.

Server	Dell PowerEdge 2970 with two Dual-Core AMD Opteron 2222 SE processors	HP ProLiant DL380 G5 with two Dual-Core Intel Xeon 5160 processors	IBM System x3650 with two Dual-Core Intel Xeon 5160 processors
Processor frequency (GHz)	3.0 GHz	3.0 GHz	3.0 GHz
Front-side bus frequency (MHz)	1,000 MHz	1,333 MHz	1,333 MHz
Number of processor packages	2	2	2
Number of cores per processor package	2	2	2
Number of hardware threads per core	1	1	1
Motherboard	Dell CN-OFP973-69702-74H-0091	HP P3021ADMQUN203	IBM 7979AC1
Chipset	Broadcom HT-2100 and HT-1000 Chipset	Intel 5000 Series Chipset	Intel 5000 Series Chipset
RAM (16 GB in each)	16 GB (8 x 2GB) PC2-5300 DDR2	16 GB (8 x 2GB) PC2-5300 FBDIMM	16 GB (8 x 2GB) PC2-5300 FBDIMM
Hard drive	5 x 73GB Seagate ST973451SS	5 x 73GB Seagate ST973451SS	5 x 73GB Seagate ST973451SS

Figure 4: Summary of some key aspects of the server configurations.

Dell configured and provided all of the systems.

With the exception of disabling the Hardware Prefetcher and Adjacent Sector Prefetcher settings on the Intel-based servers, we used the default BIOS settings on each server. We changed those two settings to match those on similar systems with published SPEC CPU2006 results.

For all systems we used the default power settings, which were the following:

- Dell PowerEdge 2970—Demand-Based Power Management (PowerNow) disabled
- Dell PowerEdge 2970 Energy Smart—Demand-Based Power Management (PowerNow) enabled
- HP ProLiant DL380 G5—HP Dynamic Power Savings Mode enabled
- IBM System x3650—PowerExecutive Power Capping enabled

We began by installing a fresh copy of SuSE Linux Enterprise Server 10 SP1. We made no additional changes to the default installation options.

SPEC CPU2006 configuration

We followed SPEC's standard instructions for building the CFP2006 executables. After studying the best results for this benchmark on the SPEC Web site, we chose the following software tools:

- HP ProLiant DL380 G5 and IBM System x3650
 - Intel C/C++ Compiler 9.1.051 for EM64T
 - Intel Fortran Compiler 9.1.051 for EM64T
- Dell PowerEdge 2970

- PathScale 3.0 C Compiler
- PathScale 3.0 C++ Compiler
- PathScale 3.0 Fortran Compiler

The benchmark requires configuration files. From the SPEC Web site we chose the most recent (as of the testing for this report) SPECCPU2006 results that used the above compiler. We copied the configuration files for those results and used them, with modifications to reflect the appropriate system information about the server under test, in our testing. The configuration files we used appear in Appendix B.

To begin the benchmark, we performed the following steps:

- Open a command prompt.
- Change to the cpu2006 directory.
- Type “./shrc” at the command prompt.
- Type “ulimit -s unlimited” at the command prompt.
- Enter “runspec -c <config file name> -r 4 -T all -v 10 fp” where
 - <config file name> = name of the configuration file

When the run completes, the benchmark puts the results in the directory \cpu2006\result. The result file names are of the form CFP2006.<number>.<suffix>. The suffixes are html, asc, raw, and pdf. The number is three digits and associates a result file with its log, e.g. CFP2006.002. asc and log.002.

Appendix A – Test system configuration information

This appendix provides detailed configuration information about each of the test server systems, which we list in alphabetical order.

Systems	Dell PowerEdge 2970 with two Dual-Core AMD Opteron 2222 SE processors	HP ProLiant DL380 G5 with two Dual-Core Intel Xeon 5160 processors	IBM System x3650 with two Dual-Core Intel Xeon 5160 processors
