Dual Intel® Xeon® Processor
X7560, 2.27 GHz
Red Hat® Enterprise Linux® 5.4

On the SPECjbb2005 benchmark

**Dell™ PowerEdge™
R810 delivers 123%
better performance**

versus

Sun "SPARC" Enterprise T5240
Dual Sun UltraSPARC T2 Plus, 1.60 GHz

PowerEdge R810 server
Dual Intel® Xeon® Processor
X7560, 2.27 GHz
Red Hat® Enterprise Linux® 5.4

On the SPECjbb2005 benchmark

OUR FINDINGS

The latest, most powerful Dell PowerEdge servers deliver better performance than Sun SPARC Enterprise servers. In Principled Technologies' tests in our labs, the Dell PowerEdge R910 and R810 servers, each with two Intel Xeon Processor X7560s, delivered higher performance results than the publicly available benchmark scores of the Sun SPARC Enterprise T5240 server. These results demonstrate the potential performance benefits of the Dell servers.

OUR PROCESS

We used the industry-standard SPECjbb2005 benchmark to focus on and measure the Java performance of the Dell PowerEdge servers. We then compared our results to publicly available SPECjbb2005 results of the Sun server.

PROJECT OVERVIEW

The Dell PowerEdge R910 server achieved a SPECjbb2005 score of 931,315, a 120.3 percent increase over the Sun SPARC Enterprise T5240 server, which achieved a SPECjbb2005 score of 422,782.¹ (See Figure 1.)

The Dell PowerEdge R810 server achieved a SPECjbb2005 score of 943,614, a 123.2 percent increase over the Sun SPARC Enterprise T5240 server, which achieved a SPECjbb2005 score of 422,782.² (See Figure 1.)

SPECjbb2005 is an industry-standard benchmark created by the Standard Performance Evaluation Corp. (SPEC) to measure a server's Java performance. (Note: SPEC and SPECjbb2005 are trademarks of the Standard Performance Evaluation Corporation.) SPEC modeled SPECjbb2005 on the three-tier client/server architecture, with the middle layer as the primary focus. According to SPEC, "Random input selection represents the first (user) tier. SPECjbb2005 fully implements the middle tier business logic. The third tier is represented by tables of objects, implemented by Java Collections, rather than a separate database."

www.spec.org/jbb2005/docs/UserGuide.html.

SPECjbb2005 utilizes multiple special data groups and multiple threads as it runs. Each data unit is a "warehouse," a roughly 25MB

collection of data objects.

Each thread represents an active user posting transaction requests within a warehouse. The benchmark run begins with one warehouse and then increases the number of warehouses; its goal is to saturate the server's processor capacity. As the

number of warehouses

increases, so does the number of threads. The benchmark's results portray the server's throughput in business

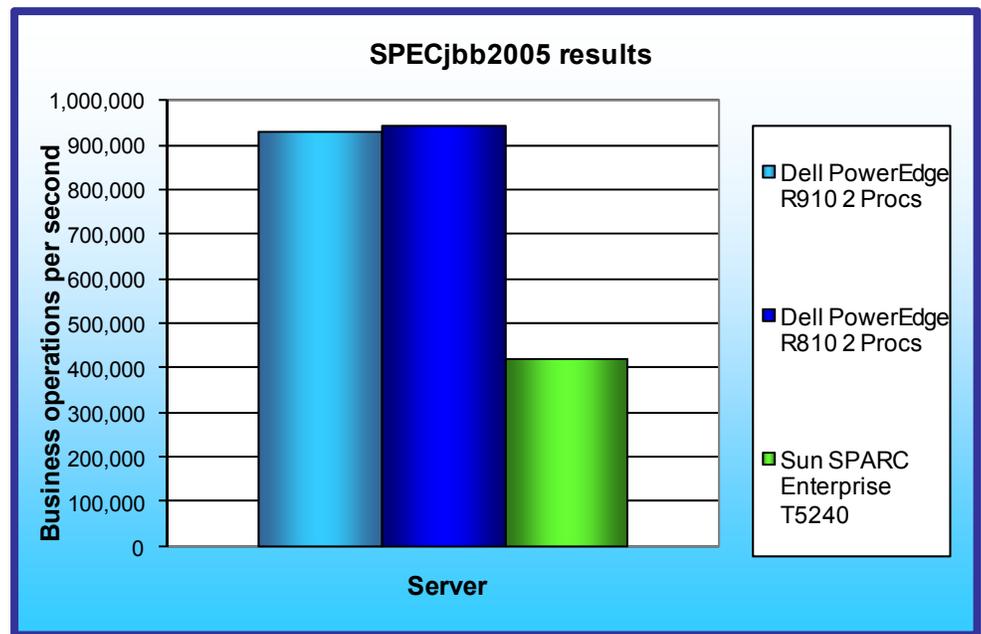

Figure 1: SPECjbb 2005 performance results. Higher numbers are better.

¹ Source: Principled Technologies®, Inc., "Dell vs. Sun servers: R910 & R810 Java performance comparison SPECjbb2005," a February 2010 report commissioned by Dell. For the latest SPECjbb2005 benchmarks, visit www.spec.org.

² *Ibid.*

operations per second or SPECjbb2005 bops. A higher number of SPECjbb2005 bops is better. (For more information on SPECjbb2005, go to www.spec.org.)

Due to licensing issues, we did not actually test SPECjbb2005 on the Sun SPARC Enterprise T5240. Instead, we used the highest posted result for the Sun system on SPEC’s site (<http://www.spec.org/osg/jbb2005/results/res2009q3/jbb2005-20090810-00764.html>).

Figure 2 shows the system configuration overview for the similarly configured Dell PowerEdge R910, Dell PowerEdge R810, and Sun SPARC Enterprise T5240 servers.

Servers	Dell PowerEdge R910	Dell PowerEdge R810	Sun SPARC Enterprise T5240

Figure 2: System configuration overview for the three test servers. See Appendix A for more details on the Dell PowerEdge servers.

WHAT WE FOUND

Figure 3 shows the median SPECjbb2005 results for all servers. In our test, we ran multiple JVMs at the same time, a common practice on servers with many processors.

	Dell PowerEdge R910	Dell PowerEdge R810	Sun SPARC Enterprise T5240
JVM 1	115,328	113,359	26,331
JVM 2	116,450	121,663	26,295
JVM 3	116,928	114,710	26,413
JVM 4	117,609	122,224	26,187
JVM 5	114,406	114,982	26,335
JVM 6	116,214	115,259	26,243
JVM 7	118,011	119,837	26,822
JVM 8	116,369	121,580	26,181

	Dell PowerEdge R910	Dell PowerEdge R810	Sun SPARC Enterprise T5240
JVM 9	N/A	N/A	26,751
JVM 10	N/A	N/A	26,733
JVM 11	N/A	N/A	26,819
JVM 12	N/A	N/A	26,176
JVM 13	N/A	N/A	26,764
JVM 14	N/A	N/A	26,249
JVM 15	N/A	N/A	26,238
JVM 16	N/A	N/A	26,245
Total score	931,315	943,614	422,782

Figure 3: SPECjbb2005 results for each server by JVM. Higher numbers are better.

To compute the overall score for the system, SPECjbb2005 sums the scores of all the JVMs. SPECjbb2005 computes the score of each JVM by taking the average of the results during mixes when the server is running at peak performance. (In SPEC's terms, these results are from "compliant" runs, which means we can disclose them publicly though we are not posting them on the SPEC Web site with all the files SPEC requires. We do present here all the data necessary to reproduce these results.)

Figure 4 shows the results by warehouse for the Dell PowerEdge R910 server for all three runs. Run 2 produced the median results.

Figure 5: SPECjbb2005 results for the Dell PowerEdge R810 server. Higher numbers are better.

HOW WE TESTED

Adjusting BIOS settings

We used all of the default BIOS settings on the Dell PowerEdge R910 server and the Dell PowerEdge R810 server. Among these settings were the following:

- Hardware Prefetcher enabled
- Adjacent Cache Line Prefetch enabled

- Node Interleaving disabled
- C States enabled

Setting up and configuring the Dell PowerEdge R910 and the Dell PowerEdge R810

We began by installing a fresh copy of Red Hat Enterprise Linux Server 5.4. We installed the default packages, disabled the firewall, and disabled SELinux. We made no additional changes to the default installation options.

After the base installation, we updated the kernel on the Dell PowerEdge R810 and Dell PowerEdge R910 from 2.6.18-164.el5 to 2.6.18-164.9.1.el5. This new kernel provided proper Nehalem-EX support in Red Hat for the Dell PowerEdge R910 and the Dell PowerEdge R810.

In addition to installing the Nehalem-EX Red Hat Enterprise Linux, we created hugepages by adding the following text to the `/etc/sysctl.conf` file:

```
vm.nr_hugepages=32000
```

SPECjbb2005 configuration

We used SPECjbb2005 version 1.07, dated March 15, 2006. We followed SPEC's run rules. (For more information about SPECjbb2005 and its run rules, see www.spec.org/jbb2005/docs/RunRules.html.) We installed SPECjbb2005 by copying the contents of the SPECjbb2005 CD to the directory `/SPECjbb2005` on each server's hard disk.

SPECjbb2005 requires a Java Virtual Machine on the system under test. We used the IBM J9 VM (build 2.4, JRE 1.6.0 IBM J9 2.4 Linux amd64-64 jvms6460sr7-20091214_49398 (JIT enabled, AOT enabled)) JVM for this testing and left the default installation settings.

After installation, as per the run rules, we edited the `SPECjbb_config.props` file in the root `SPECjbb2005` directory to include disclosure information about each server and our license information. SPECjbb2005 uses this file when generating the results output for each run. We also modified the `SPECjbb.props` file to change the number of JVM instances to 8 for the Dell PowerEdge R810 and R910 servers. This change allows a server to run 8 JVM instances during testing, depending on the server.

We created a shell file, which we placed in the root `SPECjbb2005` directory, to issue the Java run command to launch the benchmark. We used the shell file to begin the SPECjbb2005 test.

The following is the contents of the shell file that we used for the Dell PowerEdge R910 server and the Dell PowerEdge R810 server:

```
#!/bin/sh

To improve Java performance, we set Java options. The following list gives a brief description of all options we used for testing.³

- *-Xaggressive* turns on extra JVM performance optimizations.
- *-Xcompressedrefs* changes the JVM to use 32-bit reference values over 64-bit reference values.
- *-Xgcpolicy:gencon* sets the garbage collector policy to use both the combined and generational gcs to minimize gc time.
- *-Xmn1400m* sets the JVM nursery size.
- *-Xms1875m* sets the minimum heap size. We set the minimum and maximum heap sizes to be the same, so the heap size would stay a constant 1875MB.
- *-Xmx1875m* sets the maximum heap size.
- *-XlockReservation* turns on optimizations that presume a monitor is owned by the thread that last acquired it.
- *-Xnoloa* prevents allocation of large object areas.
- *-XtlhPrefetch* prefetches bytes in the thread local heap.
- *-Xlp* enables the use of hugepages for the IBM JVM.

³ Source:

http://publib.boulder.ibm.com/infocenter/javasdk/v6r0/index.jsp?topic=/com.ibm.java.doc.user.Inx.60/diag/appendixes/cmdline/commands_jvm.html

Conducting the test

To run the SPECjbb2005 test, we first mounted hugepages on our server using the following commands:

```
mkdir -p /mnt/hugepages  
mount none /mnt/hugepages -t hugetlbfs  
chmod 777 /mnt/hugepages
```

After we mounted hugepages, we ran the run shell script and the run took approximately 30 minutes to complete.

APPENDIX A – TEST SERVER INFORMATION

Figure 6 presents detailed information for the Dell PowerEdge test servers we used in this report.

Server	Dell PowerEdge R910	Dell PowerEdge R810
General dimension information		
Height (inches)	7.00	3.50
Width (inches)	17.25	17.25
Depth (inches)	29.00	29.00
U size in server rack (U)	4	2
Power supplies		
Total number	4	2
Brand and model	Dell Z1100P-00	Dell Z1100P-00
Wattage (W)	1,023	1,023
Cooling fans		
Total number	6	6
Dimensions (h x w)	5" x 5"	2.5" x 2.5 "
Voltage (V)	12	12
Amps (A)	4.80	0.95
General processor setup		
Number of processor packages	2	2
Number of cores per processor package	8	8
Number of hardware threads per core	2	2
CPU		
Vendor	Intel	Intel
Name	Xeon X7560	Xeon X7560
Stepping	D0	D0
Socket type	LGA1567	LGA1567
Core frequency (GHz)	2.27	2.27
L1 cache	32 KB + 32 KB	32 KB + 32 KB
L2 cache	256 KB (per core)	256 KB (per core)
L3 cache (MB)	24	24
Platform		
Vendor and model number	Dell PowerEdge R910	Dell PowerEdge R810
Motherboard model number	0P658H	05W7DG
Motherboard revision number	X23	X03
BIOS name and version	Dell 1.0.1 (03/14/2010)	Dell 1.0.2 (03/14/2010)
BIOS settings	Default	Default
Memory modules		
Total RAM in system (GB)	128	128
Vendor and model number	Hynix HMT151R7BFR8C-G7	Hynix HMT151R7BFR8C-G7

Server	Dell PowerEdge R910	Dell PowerEdge R810
Type	PC3-8500 DDR3	PC3-8500 DDR3
Speed (MHz)	1,066	1,066
Speed in the system currently running @ (MHz)	1,066	1,066
Timing/latency (tCL-tRCD-iRP-tRASmin)	7-7-7-20	7-7-7-20
Size (GB)	128	128
Number of RAM modules	32 x 4 GB	32 x 4 GB
Chip organization	Double-sided	Double-sided
Hard disk		
Vendor and model number	Seagate ST973452SS	Seagate ST9146852SS
Number of disks in system	2	2
Size (GB)	73	146
Buffer size (MB)	16	16

JVM Version	Java HotSpot(TM) 32-Bit Server VM on Solaris, version 1.6.0_14 Performance Release
JVM Command	psrset -e processor set number priocntl -c FX -t 250 -e java

Processor	UltraSPARC(TM) T2 Plus
MHz	1582
# of Chips	2
# of Cores	16
# of Cores/Chip	8
HW Threading Enabled?	Yes
Procs Avail to Java	128
Memory (MB)	65536
Memory Details	16x 4GB DDR2-667 FBDIMMs
Primary cache	16KB(I)+8KB(D) per core
Secondary cache	4MB per chip
Other cache	
Filesystem	ZFS
Disks	1x 146GB SCSI DISK
Other hardware	

Line	-Xmx3g -Xms3g -Xmn2g -XX:+UseParallelOldGC -XX:+AggressiveOpts -XX:ParallelGCThreads=11 -XX:LargePageSizeInBytes=256m -XX:AllocatePrefetchStyle=2 -XX:BiasedLockingStartupDelay=500 -classpath jbb.jar:check.jar spec.jbb.JBBmain -profile SPECjbb.props -id <u>JVM id</u>
JVM Initial Heap Memory (MB)	3072
JVM Maximum Heap Memory (MB)	3072
JVM Address bits	32
JVM CLASSPATH	jbb.jar: check.jar
JVM BOOTCLASSPATH	/export2/benchmarks/java/jdk1.6.0_14/jre/lib/alt-rt.jar: /export2/benchmarks/java/jdk1.6.0_14/jre/lib/resources.jar: /export2/benchmarks/java/jdk1.6.0_14/jre/lib/rt.jar: /export2/benchmarks/java/jdk1.6.0_14/jre/lib/sunrsasign.jar: /export2/benchmarks/java/jdk1.6.0_14/jre/lib/jsse.jar: /export2/benchmarks/java/jdk1.6.0_14/jre/lib/jce.jar: /export2/benchmarks/java/jdk1.6.0_14/jre/lib/charsets.jar: : /export2/benchmarks/java/jdk1.6.0_14/jre/classes
OS Version	OpenSolaris 2009.06
Other software	

Test Information	
Tested by	Sun Microsystems, Inc.
SPEC license #	6
Test location	Burlington, MA.
Test date	Jul 24, 2009
H/w available	Jul-2009
JVM	May-2009

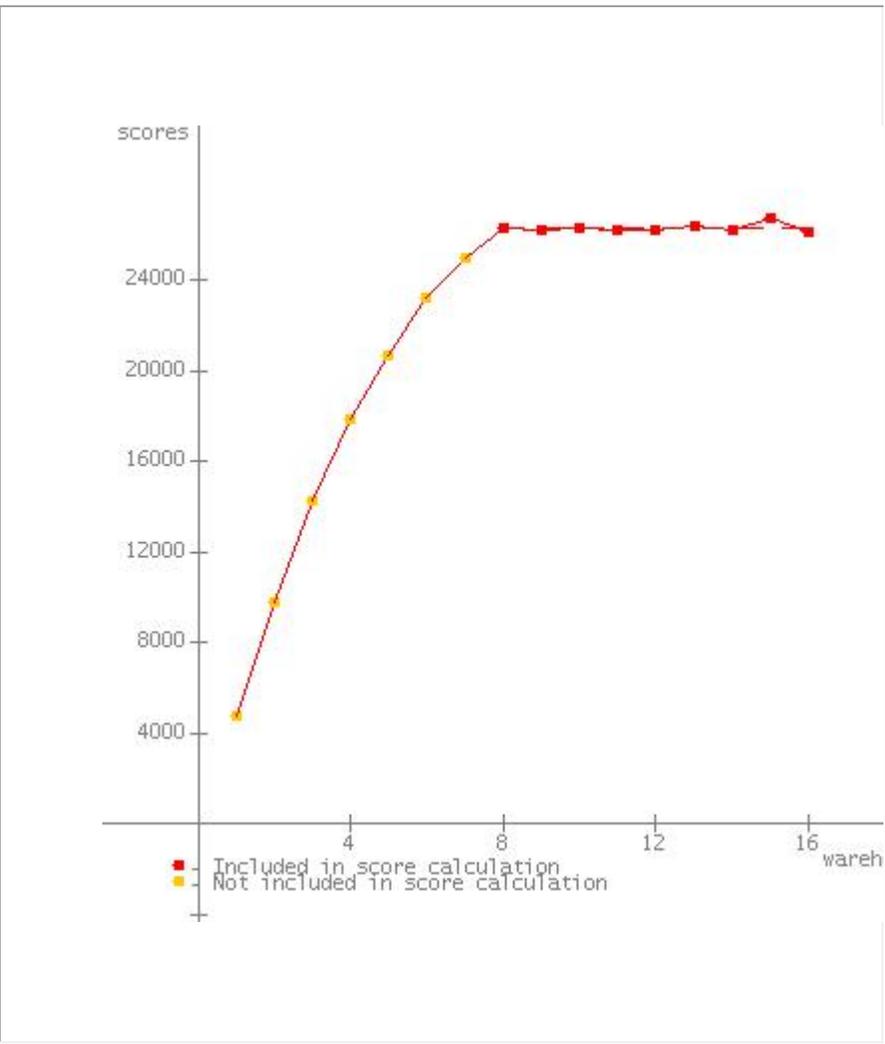

AOT Compilation	
Tuning	
Notes	
Each JVM was placed in the FX priority class with the pricntnl command. 15 JVMs were run in processor sets each containing one core. One JVM was run in the default processor set. The parameter expected_peak_warehouse was set to 8. This result was measured on the Sun SPARC Enterprise T5240. The Sun SPARC Enterprise T5240 and the Fujitsu SPARC Enterprise T5240	

available	
OS available	Jun-2009
Other s/w available	

are electronically equivalent.

ABOUT PRINCIPLED TECHNOLOGIES

Principled Technologies, Inc.
1007 Slater Road, Suite 250
Durham, NC, 27703
www.principledtechnologies.com

We provide industry-leading technology assessment and fact-based marketing services. We bring to every assignment extensive experience with and expertise in all aspects of technology testing and analysis, from researching new technologies, to developing new methodologies, to testing with existing and new tools.

When the assessment is complete, we know how to present the results to a broad range of target audiences. We provide our clients with the materials they need, from market-focused data to use in their own collateral to custom sales aids, such as test reports, performance assessments, and white papers. Every document reflects the results of our trusted independent analysis.

We provide customized services that focus on our clients' individual requirements. Whether the technology involves hardware, software, Web sites, or services, we offer the experience, expertise, and tools to help our clients assess how it will fare against its competition, its performance, its market readiness, and its quality and reliability.

Our founders, Mark L. Van Name and Bill Catchings, have worked together in technology assessment for over 20 years. As journalists, they published over a thousand articles on a wide array of technology subjects. They created and led the Ziff-Davis Benchmark Operation, which developed such industry-standard benchmarks as Ziff Davis Media's Winstone and WebBench. They founded and led eTesting Labs, and after the acquisition of that company by Lionbridge Technologies were the head and CTO of VeriTest.
