

SPEC CPU2006 SPECint_rate_base performance and power consumption on multi-processor Intel- and AMD-based servers

Executive summary

Intel® Corporation (Intel) commissioned Principled Technologies (PT) to measure the performance of SPEC® CPU2006 on multi-processor servers using the following four processors:

- Dual-Core AMD* Opteron* processor 8220 (2.80GHz, 95W)
- Dual-Core Intel Xeon® processor 7140M (3.40GHz, 150W)
- Quad-Core Intel Xeon processor E7340 (2.40GHz, 80W)
- Quad-Core Intel Xeon processor L7345 (1.86GHz, 50W)

SPEC CPU2006 is an industry-standard benchmark created by the Standard Performance Evaluation Corp. (SPEC) to measure a server's compute-intensive performance. The benchmark consequently stresses the CPU and memory subsystems of the system under test. (For more information on SPEC CPU2006 and other SPEC benchmarks, see www.spec.org.)

The SPEC CPU2006 benchmark consists of two benchmark suites, each of which focuses on a different aspect of compute-intensive performance. CINT2006 measures and compares compute-intensive integer performance, while CFP2006 measures and compares compute-intensive floating-point performance. A "rate" version of each, which runs multiple instances of the benchmark to assess server throughput, is also available. We ran only the

KEY FINDINGS

- The Quad-Core Intel® Xeon® processor E7340-based server delivered 208.9 percent more performance/watt than the Dual-Core Intel Xeon processor 7140M-based server (see Figure 1). (We calculated performance/watt using system-level power measurements.)
- The Quad-Core Intel Xeon processor L7345-based server delivered 207.9 percent more performance/watt than the Dual-Core Intel Xeon processor 7140M-based server (see Figure 1).
- The Quad-Core Intel Xeon processor E7340-based server delivered 88.0 percent more performance/watt than the Dual-Core AMD* Opteron* processor 8220-based server (see Figure 1).
- The Quad-Core Intel Xeon processor L7345-based server delivered 87.3 percent more performance/watt than the Dual-Core AMD Opteron processor 8220-based server (see Figure 1).

CINT2006 SPECint_rate_base benchmark.

In this section, we discuss the best results for each server. For complete details of the performance of each server with varying thread counts, see the Test results section.

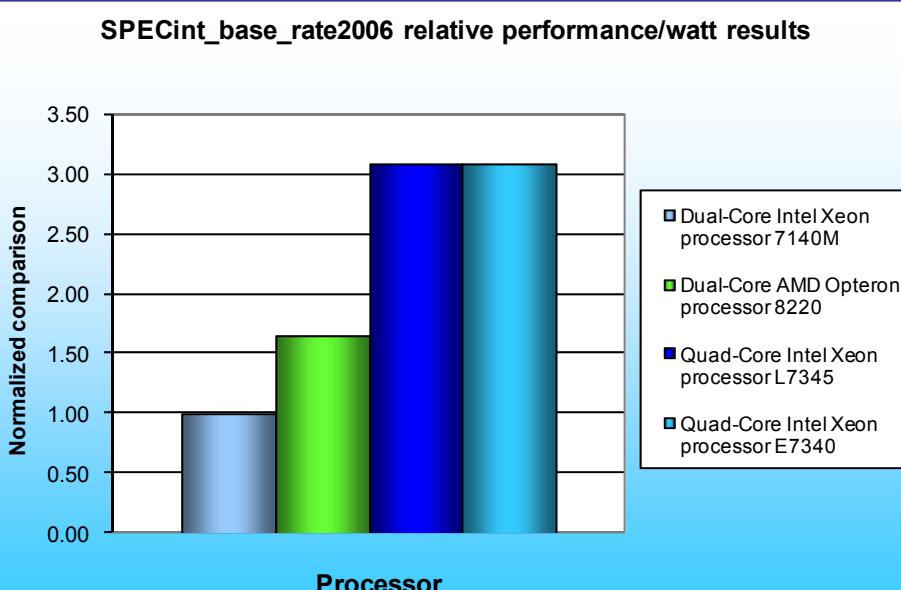

Figure 1: Performance/watt results of the test servers. Higher numbers are better.

performance/watt. Thus, higher numbers are better.

To calculate the performance/watt we used the following formula:

$$\frac{\text{benchmark score}}{\text{average power consumption in watts during period of peak performance}}$$

As Figure 1 illustrates, the Quad-Core Intel Xeon processor E7340-based server delivered 208.9 percent more performance/watt than the Dual-Core Intel Xeon processor 7140M-based server and 88.0 percent more performance/watt than the Dual-Core AMD Opteron processor 8220-based server. The Quad-Core Intel Xeon processor L7345-based server delivered 207.9 percent more performance/watt than the Dual-Core Intel Xeon processor 7140M-based server and 87.3 percent more performance/watt than the Dual-Core AMD Opteron processor 8220-based server.

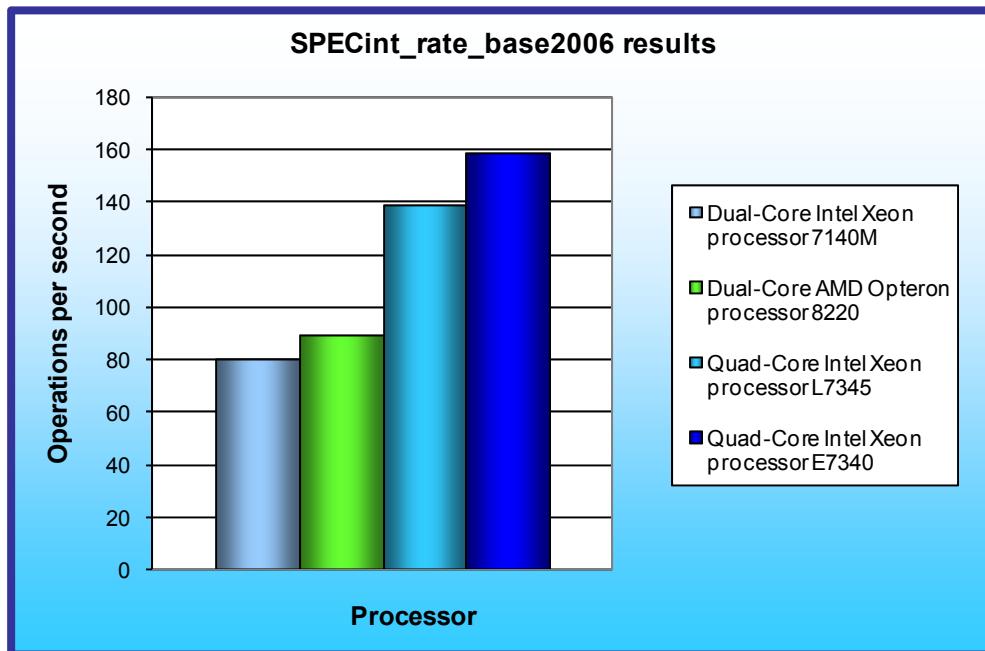

Figure 2: SPECint_rate_base2006 results of the test servers. Higher numbers are better.

SPECint_rate_base2006 score of 139.0, which is a 73.7 percent performance increase over the Dual-Core Intel Xeon processor 7140M-based server and a 56.2 percent performance increase over the Dual-Core AMD Opteron processor 8220-based server.

Workload

The SPEC CPU2006 workload includes two benchmark suites: CINT2006 and CFP2006. We ran only the CINT2006 benchmark, which focuses on measuring and comparing compute-intensive integer performance. Specifically, we measured the SPECint_rate_base2000 results for the test servers with 8 or 16 users.

Generally the best SPECint_rate_base2006 score is produced by using the same number of users as execution units for a given server. The optimum user count for our testing was 8 on the Dual-Core AMD Opteron processor 8220 server and 16 on the remaining servers: Dual-Core Intel Xeon processor 7140M, Quad-Core Intel Xeon processor E7340, and Quad-Core Intel Xeon processor L7345. The difference in user counts between the servers is due to the different number of execution units (logical or physical processors) on those servers.

Figure 2 shows the SPECint_rate_base2006 peak performance of each server. The Quad-Core Intel Xeon processor E7340-based server achieved a score of 159.0. This is a 98.8 percent performance increase over the Dual-Core Intel Xeon processor 7140M-based server, which achieved a score of 80.0. The Quad-Core Intel Xeon processor E7340-based server showed a 78.7 percent performance increase over the Dual-Core AMD Opteron processor 8220-based server, which achieved an 89.0.

The Quad-Core Intel Xeon processor L7345-based server achieved a

Figure 3 lists the 12 applications that compose the CINT2006 benchmark. SPEC wrote nine of the applications in C and three (471.omnetpp, 473.astar, 483.xalancbmk) in C++.

Name	Application area
400.perlbench	Programming language
401.bzip2	Compression
403.gcc	C compiler
429.mcf	Combinatorial optimization
445.gobmk	Artificial intelligence: Go
456.hmmer	Search gene sequence
458.sjeng	Artificial intelligence: chess
462.libquantum	Physics/quantum computing
464.h264ref	Video compression
471.omnetpp	Discrete event simulation
473.astar	Path-finding algorithms
483.xalancbmk	XML processing

Figure 3: The applications that make up the CINT2006 benchmark.

A CINT2006 run performs each of the 12 application (tasks) three times and reports the median for each. It also calculates the geometric mean of those 12 results to produce an overall score.

Test results

Figure 4 details the results of our tests with 8 or 16 users for SPECint_rate_base2006. We determined the number of users based on the number of execution units in a given server. We used the same number of SPECint_rate_base2006 users as processor execution units, so there is a one-to-one ratio.

SPECint_rate_base2006 performs three runs of each benchmark in the test suite and records the median, so the final score is a median of three runs. Higher scores are better.

Figure 4 details the power consumption, in watts, of the test servers while idle and during the benchmark. The idle power is an average of a two-minute power recording while the server was idle. The average power is an average power for the duration of the benchmark run.

Number of users	Server	SPECint_rate_base 2006 results	Idle power	Average power
8 users	Dual-Core AMD Opteron processor 8220	89.0	324.1	549.7
16 users	Dual-Core Intel Xeon processor 7140M	80.0	546.3	812.0
	Quad-Core Intel Xeon processor L7345	139.0	355.3	458.3
	Quad-Core Intel Xeon processor E7340	159.0	364.2	522.5

Figure 4: Power consumption, in watts, of the test servers while idle and during the benchmark.

Test methodology

Figure 5 summarizes some of the key aspects of the configurations of the server systems; Appendix A provides detailed configuration information.

Server	Dual-Core AMD Opteron processor 8220	Dual-Core Intel Xeon processor 7140M	Quad-Core Intel Xeon processor E7340	Quad-Core Intel Xeon processor L7345
Processor frequency (GHz)	2.8 GHz	3.4 GHz	2.4 GHz	1.86 GHz
Front-side bus frequency (MHz)	2,000 MHz HyperTransport	800 MHz	1,066 MHz	1,066 MHz
Number of processor packages	4	4	4	4
Number of cores per processor package	2	2	4	4
Number of hardware threads per core	1	2	1	1
Motherboard	HP* PB729AE9QUDO 49	Intel SE8500HW4	Intel S7000FC4UR	Intel S7000FC4UR
Chipset	NVIDIA* nForce*4	Intel SE8500	Intel ID3600	Intel ID3600
RAM (16 GB in each)	16GB (16 x 1GB) PC2-5300 DDR2	16GB (16 x 1GB) PC2-5300 DDR2	16GB (16 x 1GB) PC2-5300 FB- DDR2	16GB (16 x 1GB) PC2-5300 FB- DDR2
Hard Drive	HP DH072ABAA6	Seagate* ST3146854LC	Seagate ST973401SS	Seagate ST973401SS

Figure 5: Summary of some key aspects of the server configurations.

Intel configured and provided all four servers.

We used the default BIOS settings on each server.

We began by installing a fresh copy of Red Hat* Enterprise Linux* 5. We installed only the Software Development package, disabled the firewall and SELinux, and did not install kdump. We made no additional changes to the default installation options.

SPECCPU2006 configuration

We followed SPEC's standard instructions for building the CINT2006 executables. After studying the best results for this benchmark on the SPEC Web site, we chose the following software tools:

- Intel C/C++ Compiler 10.0.023 for EM64T (Intel-based servers)
- PathScale* 3.0 (AMD-based server)

The benchmark requires configuration files. From the SPEC Web site we chose the most recent (as of the testing for this report) SPECCPU2006 results that used the above compilers. We copied the configuration files for those results and used them, with modifications to reflect the appropriate system information about the server under test, in our testing. The configuration files we used appear in Appendix B.

We report only the base metrics for the SPECint_rate test. SPEC requires the base metrics for all reported results and sets compilation guidelines that testers must follow in building the executables for such tests.

To begin the benchmark, we performed the following steps:

- Open a command prompt.
- Change to the cpu2006 directory.
- Type “./shrc” at the command prompt.
- Enter “runspec -c <config file name> -r <#> -T base -v 10 int” where
 - <config file name> = name of the configuration file
 - <#> = 8 or 16 depending on the number of users

When the run completes, the benchmark puts the results in the directory \cpu2006\result. The result file names are of the form CINT2006.<number>.<suffix>. The suffixes are html, asc, raw, and pdf. The number is three digits and associates a result file with its log, e.g. CINT2006.002. asc and log.002.

Power measurement procedure

To record each server's power consumption during each test, we used an Extech* Instruments (www.extech.com) 380803 Power Analyzer/Datalogger. We connected the power cord from the server under test to the Power Analyzer's output load power outlet. We then plugged the power cord from the Power Analyzer's input voltage connection into a power outlet.

We used the Power Analyzer's Data Acquisition Software (version 2.11) to capture all recordings. We installed the software on a separate Intel-processor-based PC, which we connected to the Power Analyzer via an RS-232 cable. We captured power consumption at one-second intervals.

To gauge the idle power usage, we recorded the power usage for two minutes while each server was running the operating system but otherwise idle.

We then recorded the power usage (in watts) for each server during the testing at one-second intervals. To compute the average power usage, we averaged the power usage during the time the server was producing its peak performance results. We call this time the power measurement interval. See Figure 4 (idle and average peak power) for the results of these measurements.

Appendix A – Test system configuration information

This appendix provides detailed configuration information about each of the test server systems, which we list in alphabetical order.
