

SPECjbb2005 performance with varying numbers of virtual machines on Intel- and AMD-processor-based servers

Executive summary

Intel Corporation (Intel) commissioned Principled Technologies (PT) to measure the performance and power consumption of multiple virtualized instances of SPECjbb2005 in dual-processor servers using the following two processors:

- Dual-Core AMD Opteron 285 (Hewlett-Packard ProLiant DL385)
- Dual-Core Intel Xeon Processor 5160 (Supermicro SuperServer 7045B-8R+B)

To create the virtual machines on each system, we used the experimental 64-bit guest support of VMware's ESX Server, version 3.0 (www.vmware.com/products/vi/esx/). We created 4 virtual machines, each running Windows Server 2003 Enterprise x64 Edition. We tested the servers running 1, 2, and 4 virtual machines, each one executing the SPECjbb2005 benchmark. We allocated each virtual machine 1 processor and 1800 MB of RAM.

SPECjbb2005 is an industry-standard benchmark created by the Standard Performance Evaluation Corp. (SPEC) to measure a server's Java performance. SPEC modeled SPECjbb2005 on the three-tier client/server architecture, with the middle layer as the primary focus. Per SPEC, "Random input selection represents the first (user) tier. SPECjbb2005 fully implements the middle tier business logic. The third tier is represented by tables of objects, implemented by Java Collections, rather than a separate database." (www.spec.org/jbb2005/docs/UserGuide.html).

KEY FINDINGS

- The Dual-Core Intel Xeon Processor 5160-based server out performed the Dual-Core AMD Opteron 285-based server in all virtual machine environments while running SPECjbb2005
- The Dual-Core Intel Xeon Processor 5160-based server delivered 80 percent more performance on SPECjbb2005 in the single-virtual-machine environment than the Dual-Core AMD Opteron 285-based server (see Figure 1).
- In the two- and four-virtual-machine environments, the Dual-Core Intel Xeon processor 5160-based server delivered 68 and 43 percent more performance, respectively, on SPECjbb2005 than the Dual-Core AMD Opteron 285-based server (see Figure 1).

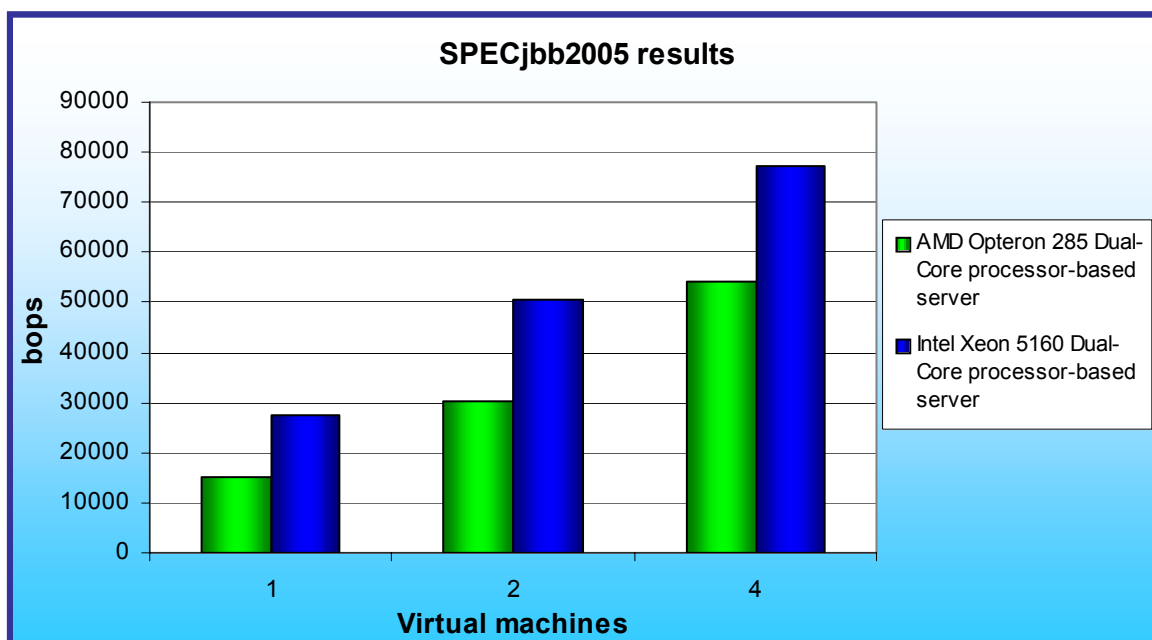

Figure 1: SPECjbb2005 business operations per second results for the two test servers with 1, 2, and 4 virtual machines. Higher numbers of operations per second are better.

SPECjbb2005 utilizes multiple special data groups and multiple threads as it runs. Each data unit is a "warehouse", which is a roughly 25MB collection of data objects. Each thread represents an active user posting transaction requests within a warehouse. The benchmark run begins with one warehouse and then increases the number of warehouses; its goal is to saturate the server's processor capacity. As the number of warehouses increases, so does the number of threads. The benchmark's results portray the server's throughput in bops (business operations per second). Because bops is a rate, a higher number of bops is better. (For more information on SPECjbb2005, go to www.spec.org.)

Figure 1 shows the SPECjbb2005 test results, in bops, of the two test servers running one, two, and four virtual machines. Each result is the median peak score of three runs of the benchmark. A higher SPECjbb2005 score indicates the server is able to handle more Java requests and thus deliver greater throughput.

The Dual-Core Intel Xeon Processor 5160-based server produced higher results in all three environments.

In the one-virtual-machine environment, the Dual-Core Intel Xeon Processor 5160-based server was 80 percent faster over the Dual-Core AMD Opteron 285-based server. With two virtual machines, the difference was 68 percent while with four virtual machines the Dual-Core Intel Xeon Processor 5160-based server was 43 percent faster.

See the Test Results section for the scores from all three runs. A higher SPECjbb2005 score indicates the server is able to handle more Java requests and thus deliver greater throughput.

Test results

Figures 2 through 4 show the median SPECjbb2005 results for both servers with 1, 2, and 4 virtual machines executing the benchmark. SPECjbb2005 computes its score by taking the average of the results during mixes when the server is running at peak performance. (In SPEC's terms, these results are from "compliant" runs, which means we can disclose them publicly though we are not posting them on the SPEC Web site with all the SPEC required files. We do present here all the data necessary to reproduce these results.)

SPECjbb2005 results with 1 virtual machine (bops)		
Server	Dual-Core AMD Opteron 285-based server	Dual-Core Intel Xeon Processor 5160-based server
Warehouse 1	14537	26635
Warehouse 2	15930	28070
Warehouse 3	15770	27472
Warehouse 4	15434	26425
Warehouse 5	15034	25095
Warehouse 6	14744	24083
Warehouse 7	14452	22790
Warehouse 8	14155	21428
Score	15233	27352

Figure 2: SPECjbb2005 median results in business operations per second (bops), both per warehouse and overall, for the two test servers with 1 virtual machine. Higher numbers are better.

With only 1 virtual machine running the benchmark, each server produces a single SPECjbb2005 result. As Figures 3 and 4 illustrate, when multiple virtual machines are each executing the benchmark, each virtual machine produces its own score. To obtain the total bops score for a server in this configuration, we sum the scores of all the virtual machines. A higher number of bops is better in all cases.

SPECjbb2005 results with 2 virtual machines (bops)				
Server	Dual-Core AMD Opteron 285-based server		Dual-Core Intel Xeon Processor 5160-based server	
	VM1	VM2	VM1	VM2
Warehouse 1	14279	14476	24139	24443
Warehouse 2	15607	15975	26408	26285
Warehouse 3	15538	15849	26310	26131
Warehouse 4	15187	15508	25041	25035
Warehouse 5	15030	15166	23834	23828
Warehouse 6	14525	15024	22826	22913
Warehouse 7	14237	14754	21874	21618
Warehouse 8	13807	14136	20439	20885
Score	14943	15225	25274	25364
Combined VM Score	30168		50638	

Figure 3: SPECjbb2005 median results in business operations per second (bops), both per warehouse and overall, for the two test servers with 2 virtual machines. Higher numbers are better.

SPECjbb2005 results with 4 virtual machines (bops)

Figure 4: SPECjbb2005 median results in business operations per second (bops), both per warehouse and overall, for the two test servers with 4 virtual machines. Higher numbers are better.

Test methodology

Figure 5 summarizes some key aspects of the configurations of the two server systems; Appendix A provides detailed configuration information. Intel provided both servers.

Server	Dual-Core AMD Opteron 285-based server	Dual-Core Intel Xeon processor 5160-based server
Vendor	Hewlett-Packard	Supermicro
Model	ProLiant DL385	SuperServer 7045B-8R+B
Processor frequency (GHz)	2.6GHz	3.0GHz
Single/Dual-Core processors	Dual	Dual
Motherboard	HP ProLiant DL385 G1 399684-001	Supermicro X7DB8+
Chipset	AMD 8111/8131 chipset	Intel 5000P Chipset
RAM (8GB in each)	8 x 1GB PC-3200	8 x 1GB PC2-4400 FBDIMM
Hard Drive	3 x Seagate Cheetah ST336754LC 15K RPM 37 GB drives attached through Adaptec 39320A-R PCI-X 133-MHz SCSI controller	3 x Seagate Cheetah ST336754LC 15K RPM 37 GB drives attached through Adaptec 39320A-R PCI-X 133-MHz SCSI controller

Figure 5: Summary of some key aspects of the server configurations.

The difference in RAM types reflects the capabilities of the two motherboards: The Supermicro X7DB8+ motherboard offered two independent front-side busses at a speed of 1333 MHz and contained Fully-Buffered DIMM (FBDIMM) modules that used commodity DDR2 PC2-4400 533-MHz memory components. The HP ProLiant DL385 G1 motherboard supported 184-pin DDR memory, and the highest memory speed available for the Dual-Core AMD Opteron 285-based server was DDR PC3200 400-MHz RAM.

With the following exceptions, we used the default BIOS settings on each server: we disabled the HW Prefetcher and the Adjacent Cache Line Prefetcher on the Dual-Core Intel Xeon processor 5160-based server. These options were not available on the Dual-Core AMD Opteron 285-based server.

We began by installing a fresh copy of Microsoft Windows Server 2003 x64 Enterprise Edition Service Pack 1 on each server on the third SCSI drive. We followed this process for each installation:

1. Assign a computer name of "AMD" or "INTEL", depending on the server.
2. For the licensing mode, use the default setting of five concurrent connections.
3. Enter the password "password" for the administrator log on.
4. Select Eastern Time Zone.
5. Use specific IP address for the Network installation.
6. Use the default name "WORKGROUP" for the workgroup.

We applied the following updates from the Microsoft Windows Update site:

- Security Update for Windows Server 2003 x64 Edition (KB911280)
- Security Update for Windows Server 2003 x64 Edition (KB917953)
- Security Update for Windows Server 2003 x64 Edition (KB918439)
- Security Update for Windows Server 2003 x64 Edition (KB917344)
- Security Update for Windows Server 2003 x64 Edition (KB914389)
- Security Update for Windows Server 2003 x64 Edition (KB917734)
- Security Update for Windows Server 2003 x64 Edition (KB908531)
- Security Update for Windows Server 2003 x64 Edition (KB911562)

- Security Update for Windows Server 2003 x64 Edition (KB911927)
- Security Update for Windows Server 2003 x64 Edition (KB908519)
- Security Update for Windows Server 2003 x64 Edition (KB912919)
- Security Update for Windows Server 2003 x64 Edition (KB896424)
- Security Update for Windows Server 2003 x64 Edition (KB900725)
- Security Update for Windows Server 2003 x64 Edition (KB902400)
- Security Update for Windows Server 2003 x64 Edition (KB904706)
- Security Update for Windows Server 2003 x64 Edition (KB901017)
- Security Update for Windows Server 2003 x64 Edition (KB890046)
- Security Update for Windows Server 2003 x64 Edition (KB899587)
- Security Update for Windows Server 2003 x64 Edition (KB899591)
- Security Update for Windows Server 2003 x64 Edition (KB893756)
- Security Update for Windows Server 2003 x64 Edition (KB899588)
- Security Update for Windows Server 2003 x64 Edition (KB901214)
- Security Update for Windows Server 2003 x64 Edition (KB896422)
- Security Update for Windows Server 2003 x64 Edition (KB896358)
- Security Update for Windows Server 2003 x64 Edition (KB896428)
- Security Update for Windows Media Player Plug-in (KB911564)
- Update for Windows Server 2003 x64 Edition (KB898715)
- Update for Windows Server 2003 x64 Edition (KB914784)
- Update for Windows Server 2003 x64 Edition (KB910437)
- Cumulative Security Update for Internet Explorer for Windows Server 2003 x64 Edition (KB916281)
- Cumulative Security Update for Outlook Express for Windows Server 2003 x64 Edition (KB911567)

To improve Java performance, we enabled large pages in memory on all servers. To enable this service, the administrator must first assign additional privileges to the user who will be running the application. We assigned this privilege only to the administrator, because we used that account for our tests. To enable large pages, we did the following:

- Select Control Panel -> Administrative Tools -> Local Security Policy.
- Select Local Policies -> User Rights Assignment.
- Select "Lock pages in memory", add users and/or groups.

Installing the server and configuring the SCSI drives

We set up the servers so we could run 1, 2, or 4 virtual machines under the experimental 64-bit guest support of VMware's ESX Server, version 3.0. We first created a partition on one disk drive and installed Windows Server 2003 Enterprise x64 Edition. We then installed VMware ESX Server, version 3.0 and edited the Grub loader so we could dual-boot the operating systems. Figure 6 illustrates the disk layout we used to accommodate both operating systems and four virtual machines.

SCSI drives	Partition type	Partition size
SCSI drive 1		
Windows boot partition	ntfs	20MB
/boot	ext3	100MB
/	ext3	4000MB
Swap	swap	544MB
Vmkore	vmkore	100MB
Virtual machine storage (x2)	vmfs	29000MB
SCSI drive 2		
/var/log	ext3	2000MB
Virtual machine storage (x2)	vmfs	29000MB
SCSI drive 3		
Windows Server 2003 Enterprise x64 Edition	ntfs	6000MB
Virtual machine storage (x2)	vmfs	29000MB

Figure 6: SCSI drive configurations for both operating systems and all the virtual machines.

Installing VMware ESX Server 3.0

We installed VMware ESX Server 3.0 by following this process:

1. Reboot the server with the VMware ESX Server CD in the CD-ROM drive. The installation wizard will start and guide the installation process.
2. Assign a host name ("amd.localhost" or "intel.localhost", as appropriate).
3. Enter the password "password" for the administrator account.
4. Select Eastern/New York Time Zone.
5. Use specific IP addresses for each server.
6. Once the installation is complete, reboot the server.
7. Log into the VMware ESX 3.0 Server.
8. Edit the Grub configuration file (grub.conf) in the boot/grub directory and add the following lines:

```

title Windows Server 2003 Enterprise x64 Edition
    rootnoverify (hd0,0)
    chainloader +1
      
```
10. Attach one management desktop system directly to each server using a crossover Cat 5 network cable.
11. Apply IP addresses in the same subnet as the above IP address.
12. On each management desktop system, use a Web browser to work with the Web interface available in VMware's ESX Server 3.0.
13. Download and install the VMware Virtual Infrastructure Client 2.0 from the VMware ESX 3.0 Server. This software serves as a management console to the VMware ESX Server and lets you build and set the resources for each of the virtual machines.
14. Mount the vmfs partitions in Figure 6.
 - In the Configuration tab of the Virtual Infrastructure Client, click the Storage (SCSI, SAN, and NFS) item under Hardware.
 - Use the Add Storage... wizard to mount each directory.
 - Accept all default settings with one exception: mount only the partition you designated for virtual machine storage, not the entire SCSI drive.
 - Repeat this three more times and name the three storage partitions storage1, storage2, and storage3.
15. Use the New Virtual Machine Wizard to create the first virtual machine with the following parameters:
 - Storage area: storage1
 - Guest operating system: Microsoft Windows Server 2003, Enterprise x64 Edition
 - Memory: 1800MB
 - Number of NICs: 1

- Hard disk space: 8 GB
 - CPUs: 1 virtual processor
 - SCSI controller type: LSI Logic
 - Virtual machine name: windows64-1
20. After creating the first virtual machine with the VMware Infrastructure Client, place the Windows Server 2003 CD in the management desktop system.
 21. Power on the virtual machine.
 22. Mount the virtual CD-ROM drive connecting the virtual machine to the CD-ROM drive on the management desktop system.
 23. The virtual machine will boot and detect the bootable installation disk.
 24. Install Windows Server 2003 Enterprise x64 Edition with the same configuration and updates we showed previously.
 25. Install VMware tools by clicking Inventory->Virtual Machine->Install VMware Tools.
 26. Follow the installation wizard accepting all of the default settings.
 27. Enable time synchronization between the virtual machine and the host system by doing the following:
 - Click the VMware Tools icon in the task bar.
 - Check “Time synchronization between the virtual machine and the console operating system”.
 - Click Apply.
 - Click OK.
 28. To reduce the resource consumption for each virtual machine, we disabled the following Windows services in Start – Administrative Tools – Services:
 - automatic updates
 - computer browser
 - cryptographic services
 - dhcp client
 - distributed link tracking client
 - distributed transaction coordinator
 - dns client
 - help and support
 - ipsec services
 - logical disk manager
 - print spooler
 - protected storage
 - remote registry
 - secondary logon
 - shell hardware detection
 - system event notification
 - task scheduler
 - tcp/ip netbios helper
 - windows time
 - wireless configuration
 29. Shut down Windows and make sure the virtual machine is completely powered down.

Cloning the virtual machines

To create the other virtual machines, we did the following:

1. On the VMware ESX Server, push Alt-F1 to switch to a console.
2. Log in as root.
3. Maneuver to the storage area where the newly created virtual machine resides: /vmfs/volumes.
4. VMware has already created a directory in storage1 named windows64-1 for the first virtual machine you previously built.

5. Use the mkdir command to create the directories for the other virtual machines. Spread the directories so that each storage area contains two. For example, you might enter the following:
 - mkdir ./storage2/windows64-2
 - mkdir ./storage3/windows64-3
 - mkdir ./storage3/windows64-4
6. When you finish this process, each storage partition should have two virtual machine directories.
7. Maneuver to the directory that holds the first virtual machine (/vmfs/volumes/storage1/windows64-1).
8. Copy the two core files, windows64-1.vmdk and windows64-1-flat.vmdk, to one of the directories you just created.
9. On the management desktop system running VMware Virtual Infrastructure Client, click the Virtual Machines tab.
10. Click File->New->Virtual Machine...
11. Use the Custom selection for Wizard Type and configure each virtual machine with the same parameters as above.
12. At the Select a Disk screen, choose Use an existing virtual disk.
13. Click Next.
14. Maneuver to the directory of the next virtual machine.
15. Repeat Steps 9 through 14 for the remaining virtual machines.
16. Boot each virtual machine, one at a time, starting with virtual machine No. 2.
17. Change the IP address to the next address in numerical order.
18. Change the computer name to the next name in logical succession (for example, windows64-2, and windows64-3).
19. Reboot the virtual machine.

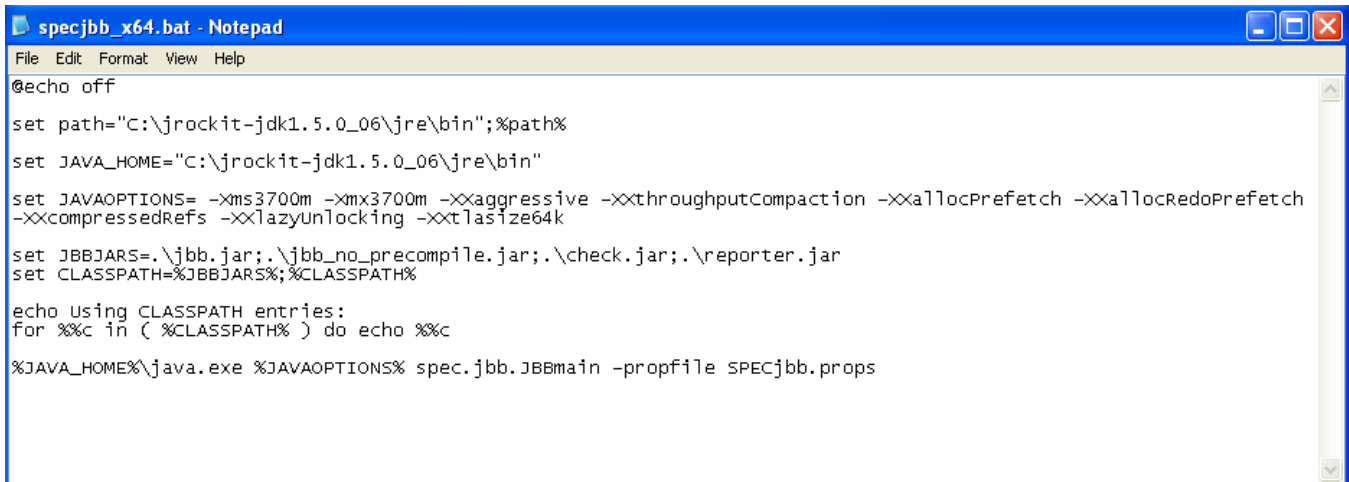

SPECjbb2005 configuration

We used SPECjbb2005 version 1.07, dated March 15, 2006. We followed SPEC's run rules. (For more information about SPECjbb2005 and its run rules, see www.spec.org/jbb2005/docs/RunRules.html.) We installed SPECjbb2005 by copying the contents of the SPECjbb2005 CD to the directory C:\SPECjbb2005 on each server's hard disk.

SPECjbb2005 requires a Java Virtual Machine (JVM) on the system under test. We used the BEA JRockit 5.0 update 6 (P26.4.0-10-62459-1.5.0_06-20060529-2101-win-x86_64 for Microsoft Windows) JVM for this testing and left the default installation settings.

After installation, as per the run rules we edited the SPECjbb_config.props file in the root SPECjbb2005 directory to include disclosure information about the server and our license information. SPECjbb2005 uses this file when generating the results output for each run.

We created a batch file in the root SPECjbb2005 directory to issue the Java run command that launched the benchmark. Intel created the scripts we used to launch this benchmark. Figure 7 shows the contents of the batch file.

```
specjbb_x64.bat - Notepad
File Edit Format View Help
@echo off
set path="C:\jrockit-jdk1.5.0_06\jre\bin";%path%
set JAVA_HOME="C:\jrockit-jdk1.5.0_06\jre\bin"
set JAVA_OPTIONS= -Xms3700m -Xmx3700m -XXaggressive -XXthroughputCompaction -XXallocPrefetch -XXallocRedoPrefetch
-XXcompressedRefs -XXlazyUnlocking -XXtlasize64k
set JBBJARS=.\jbb.jar;.\jbb_no_precompile.jar;.\check.jar;.\reporter.jar
set CLASSPATH=%JBBJARS%;%CLASSPATH%
echo Using CLASSPATH entries:
for %%c in ( %CLASSPATH% ) do echo %%c
%JAVA_HOME%\java.exe %JAVA_OPTIONS% spec.jbb.JBBmain -propfile SPECjbb.props
```

Figure 7: The text of the batch file we used to execute the SPECjbb2005 benchmark on all servers.

In the batch file we used the “set JAVA_OPTIONS” command to set the Java options that control the performance of the JVM. Intel specified the following Java option settings:

- *-Xms1024m* This option sets the minimum heap size. We set the minimum and maximum heap sizes to be the same, so the heap size would stay a constant 1024 MB.
- *-Xmx1024m* This option sets the maximum heap size.
- *-XXaggressive* This option basically tells the JVM to perform at maximum speed.
- *-XXthroughputCompaction* This option adjusts the compaction ratio dynamically based on live data in the heap.
- *-XXallocPrefetch* This option tells the JVM to prefetch a chunk of data when it uses a related, earlier bit of data.
- *-XXallocRedoPrefetch* This option also affects JVM prefetch behavior.
- *-XXcompressedRefs* This option turns on compressed references.
- *-XXlazyUnlocking* This option affects when the JVM releases locks.
- *-XXtlasize64k* This option sets the thread-local area size the JVM uses.

Launching the benchmarks simultaneously in multi-virtual-machine environments

To run copies of SPECjbb2005 in multiple virtual machines simultaneously, we ran a DOS batch file that used the presence of a file as a flag to determine when to start the benchmark. The batch file ran a simple loop with a sleep delay of one second in each loop. The loop continued until it located a specific file, at which point it waited 30 seconds and then launched SPECjbb2005.

We placed the looping batch file in the root directory of each virtual machine. From our desktop management system, we mapped network drives to each of the four virtual machines and created another batch file in the desktop management system to copy the launching file to each virtual machine. Once we had launched the looping batch file in each virtual machine, we moved to the desktop system and launched the copying batch file.

After each test, we powered off the virtual machines and restarted VMware ESX Server before running the test again.

Appendix A – Test server configuration information

This appendix provides detailed configuration information about each of the test server systems, which we list in alphabetical order.

Processors	Dual-Core AMD Opteron 285	Dual-Core Intel Xeon processor 5160

File system	NTFS	NTFS
Kernel	ACPI Multiprocessor x64-based PC	ACPI Multiprocessor x64-based PC
Language	English	English
Microsoft DirectX version	DirectX 9.0c	DirectX 9.0c
Operating system (VMware)		
Name	VMware ESX Server 3.0	VMware ESX Server 3.0
File system	ext3 (server) vmfs (virtual machines)	ext3 (server) vmfs (virtual machines)
Kernel	Version 2.4.21-37.0.2	Version 2.4.21-37.0.2
Language	English	English
Graphics		
Vendor and model number	ATI Rage XL	ATI Rage XL
Chipset	ATI Rage XL PCI (B41)	ATI Rage XL PCI (B41)
BIOS version	GR-xlcpq-5.882-4.333	GR-xlints3y.09a-4.332
Type	Integrated	Integrated
Memory size	8 MB	8 MB
Resolution	800 x 600	800 x 600
Driver	VMware SVGA II, VMware Inc., Version 11.2.0.0	VMware SVGA II, VMware Inc., Version 11.2.0.0
Network card/subsystem		
Vendor and model number	Broadcom dual NetXtreme Gigabit	Intel PRO/1000 EB Network Connection
Type	Integrated	Integrated
Driver	Microsoft Intel PRO/2000 MT Version 8.1.8.0 (VMware)	Microsoft Intel PRO/2000 MT Version 8.1.8.0 (VMware)
Optical drive		

Vendor and model number	Samsung SN-124	LITE-ON SOHC-5236V
Type	CD-ROM	DVD/CD-ROM
Interface	Internal	Internal
USB ports		
# of ports	3 (1 front, 2 back)	4 (2 front, 2 back)
Type of ports (USB 1.1, USB 2.0)	USB 1.1	USB 2.0

Figure 8: Detailed configuration information for the two test servers.

Appendix B – SPECjbb2005 output

This appendix provides the benchmark output for both of the test servers in each of the virtual-machine configurations we tested.

Dual-Core AMD Opteron 285-based server with 1 virtual machine

SPECjbb2005
